

The Dose-Fit Assessment

Why standard GLP-1 doses stall — and what a clinician would look at for yours

The Dose-Fit Assessment

Why standard GLP-1 doses stall — and what a clinician would look at for yours.

Most GLP-1 programs hand everyone the same vial and the same step-up schedule, whether or not that fits the person. This 2-minute assessment maps where you are right now — stalled, side-effect-sensitive, just starting, or worried about keeping it off — so you can see, in plain language, what a licensed clinician would actually evaluate when considering a plan for you.

What this is — and isn't. This is an educational, directional assessment. It does not diagnose anything, prescribe anything, or tell you a specific dose. It can't see your labs or your history. Only a licensed clinician can decide whether a GLP-1 medication is right for you and what your plan should be. Compounded medications are not FDA-approved and are not the same as Ozempic, Wegovy, Zepbound, or Mounjaro. We share possible side effects openly, and results vary from person to person.

How it works

- 10 quick questions. Most people finish in about two minutes.
- Pick the answer closest to your experience. There are no wrong answers.
- At the end, you'll get your **Dose-Fit Profile** — a plain-language read on your situation and the questions worth bringing to a clinician.
- Your profile is a starting point for a conversation, not a verdict. A clinician makes the call.

The Questions

Q1. Where are you in your GLP-1 journey right now?

- **A.** I've never taken a GLP-1 medication, but I'm exploring it.
 - **B.** I'm fairly new — in my first few weeks or months.
 - **C.** I've been on it a while and things have slowed down or stopped.
 - **D.** I've been on it, and I'm thinking about how I eventually come off it.
 - **E.** I tried one before and stopped because of how it made me feel.
-

Q2. If you've used a GLP-1, how did your body handle the standard dose? (If you haven't, pick the one that matches your worry.)

- **A.** I haven't started, but side effects are my biggest hesitation.
 - **B.** Mostly fine — some early queasiness that settled down.
 - **C.** Manageable, but every dose increase hit me hard.
 - **D.** Rough. Nausea, fatigue, or stomach issues that didn't let up.
 - **E.** It felt fine, almost too fine — I'm not sure it was doing much.
-

Q3. What's happening with your appetite and "food noise" lately?

- **A.** Still loud — I think about food constantly.
 - **B.** Quieter than before, but it's been creeping back.
 - **C.** Nicely quiet — this part is working for me.
 - **D.** So quiet I sometimes forget to eat, which doesn't feel right.
 - **E.** I haven't started yet, so I don't have a read on this.
-

Q4. How would you describe your progress over the last 4-6 weeks?

- **A.** Haven't started — this is research mode.
 - **B.** Moving in the right direction and feeling steady.
 - **C.** Stalled. The scale and my measurements aren't budging.
 - **D.** Up and down — progress, then it slips back.
 - **E.** I've reached a place I'm happy with and want to hold it.
-

Q5. When you imagine the long game, what's your biggest worry?

- **A.** That I won't qualify or it won't be right for me.
 - **B.** That the side effects will be too much to stick with.
 - **C.** That I'll plateau and stay stuck.
 - **D.** That I'll lose the weight and then gain it all back when I stop.
 - **E.** That I'll never really understand what's happening in my body.
-

Q6. How do you feel about the "one dose for everyone" approach most programs use?

- **A.** I assumed that's just how it works.
- **B.** It worries me — I don't think I'm average.
- **C.** It already failed me. Standard dosing didn't fit my body.
- **D.** I'd want a clinician adjusting it as I go, not a fixed schedule.
- **E.** I want to understand the *why* before I decide anything.

Q7. How much has your current or past program actually checked in with you?

- **A.** I'm not on a program yet.
 - **B.** Regularly — I feel looked after.
 - **C.** Rarely. I mostly get a refill and silence.
 - **D.** Only when I chase them down.
 - **E.** Never been on one, but ongoing care matters to me a lot.
-

Q8. Which statement sounds most like you?

- **A.** "I just want to know if this is even an option for me."
 - **B.** "I want the lowest amount that works, with the fewest side effects."
 - **C.** "I was doing great, and then everything stopped."
 - **D.** "I'm scared of the moment I stop and it all comes back."
 - **E.** "I want a real person watching my dose, not an algorithm."
-

Q9. How do you tend to make health decisions?

- **A.** I research everything before I commit.
 - **B.** I want a trusted clinician to guide me.
 - **C.** I've tried a lot of things; I'm cautious but motivated.
 - **D.** I want transparency — costs, side effects, all of it, up front.
 - **E.** I want to start simple and adjust as I learn.
-

Q10. What would make you feel genuinely confident in a GLP-1 plan?

- **A.** Knowing a licensed clinician evaluated *me*, not the average patient.
 - **B.** Knowing exactly what I'm paying, with no surprise renewals.
 - **C.** Knowing my dose could be adjusted to my body and how I feel.
 - **D.** Knowing there's a plan for when I'm ready to taper off.
 - **E.** Knowing where my medication is made and who's accountable for it.
-

Find your profile

There's no scorecard here — just notice the theme most of your answers leaned toward, then read the matching profile below.

Profile	Core theme
Starter	Exploring, hasn't begun, wants to know if it's right for them
Plateau	Was progressing, now stuck on a standard dose
Sensitive	Hit a side-effect wall; needs a gentler, clinician-tuned approach
Off-Ramp	Reached a good place; worried about regain when stopping

If you're mostly exploring or just starting, read **The Curious Starter**. If you were progressing and have now stalled, read **The Stalled Achiever**. If side effects have been your main struggle, read **The Side-Effect-Sensitive**. If your biggest worry is keeping the weight off when you stop, read **The Off-Ramp Planner**.

Result Profiles

Profile 1 — The Curious Starter

Your read: You're doing the smart thing — researching before you start. You want to know if a GLP-1 medication is even right for you before you commit to anything, and you'd rather understand *how* it works than be sold on hype.

What tends to be true for people here:

- You haven't started yet, or you're very early.
- Side effects and "will this even work for me" are your main questions.
- You want a real clinician to look at your situation, not a one-size-fits-all funnel.

What a licensed clinician would want to look at:

- Your health history, current medications, and whether a GLP-1 is appropriate for you at all.
- How your body might respond, and a careful, gradual start if it's a fit.
- What's realistic for you — including the parts that aren't fun, like possible nausea or fatigue early on.

What to know honestly: GLP-1 medications work *with* your body's own appetite signals. They can support weight management when prescribed as part of a care plan — they're not a guarantee, and like any medication they carry possible side effects. Compounded options are not FDA-approved and aren't the same as branded GLP-1s.

Your next step: The best starting point is a clinician deciding whether this is right for you. Our membership starts with exactly that — a licensed clinician evaluating your situation before anything else. Flat monthly price, cancel anytime, no surprises. → *See if you're eligible*.

Profile 2 — The Stalled Achiever

Your read: You were moving. Appetite quieted, the scale cooperated — and then it didn't. A standard dose got you partway, and now the same dose isn't doing what it used to. That's a common place to land, and it's frustrating precisely because you did everything right.

What tends to be true for people here:

- Early progress that flattened out on a fixed dose.
- Food noise creeping back, or measurements that won't move.
- A program that refills your prescription but rarely checks in.

What a licensed clinician would want to look at:

- Where you are now versus where you started, and what's changed.
- Whether your current plan still fits your body — and what adjustment, if any, makes sense.
- The whole picture: appetite, energy, side effects, and how you actually feel day to day.

Why a standard dose can stop fitting: Off-the-shelf step-up schedules are built for the average patient, and bodies adapt at different rates. When a plan stalls, the question a clinician asks isn't "more is always better" — it's "what, if anything, does *this* person need now?" That's a clinical judgment, made with you, not a fixed schedule.

Your next step: This is the gap our membership is built for — a clinician who reviews your situation instead of leaving you on autopilot. When a commercially available product isn't the right fit, a licensed clinician may determine a compounded option is appropriate for an individual patient and documents the clinical reason; any dose is a clinician's call. Flat monthly price, cancel anytime. → *See if you're eligible.*

Profile 3 — The Side-Effect-Sensitive

Your read: Your body feels things. Maybe every dose step-up hit hard, or the nausea and fatigue never really settled. You're not looking for the biggest dose — you're looking for the *right* one: enough to help, gentle enough to live with.

What tends to be true for people here:

- Standard step-up schedules felt too fast or too strong.
- Side effects that lingered instead of fading.
- A real fear that "more" just means "worse."

What a licensed clinician would want to look at:

- How you've reacted so far and what your body tolerates.
- Whether a slower, more gradual approach is appropriate for you.
- A clear, honest plan for what to watch for and when to check in.

What to know honestly: There's no proven "microdose protocol" — anyone promising one is overselling. What's real is that titration is a clinical decision: a licensed clinician deciding how to adjust your plan based on how *you* respond. Going gentler isn't a guarantee of fewer side effects, but matching the plan to your body is exactly the kind of judgment a clinician is there to make.

Your next step: If standard dosing didn't fit, you don't need a different vial — you need a clinician paying attention. Our membership is built on clinician-managed care that adjusts to how you actually feel, with side effects named openly, not buried. Flat monthly price, cancel anytime. → *See if you're eligible.*

Profile 4 — The Off-Ramp Planner

Your read: You've gotten somewhere you're proud of. Now the question keeping you up isn't "how do I lose more" — it's "how do I keep this without white-knuckling it forever?" The fear of regaining everything the day you stop is real, and most programs go quiet exactly when you need them most.

What tends to be true for people here:

- You're at or near a place you're happy with.
- Regain after stopping is your single biggest worry.
- You want a thoughtful plan for the long term, not just refills.

What a licensed clinician would want to look at:

- Where you are now and what "maintaining" realistically looks like for you.
- Whether and how a gradual, clinician-managed approach to changing your dose fits your situation.
- The full long game: not just the medication, but how you sustain your results.

What to know honestly: Nobody can promise you won't regain weight — anyone who does is selling you something. What a clinician *can* do is help you plan the long term deliberately instead of stopping cold and hoping. How and whether to taper is a clinical decision, made with you.

Your next step: Most programs help you lose it and disappear. Our membership is a long-term partnership — a clinician managing your plan through every phase, including the one most brands ignore. Flat monthly price, cancel anytime, no surprise renewals. → *See if you're eligible.*

Universal Closing

Whatever your profile, the honest truth is the same: a quiz can point you in a direction, but only a licensed clinician can decide what's right for your body. That's the whole point of having a

real person in the loop.

If you want that — a clinician who reviews your situation and decides whether and how a GLP-1 plan fits you, at a flat monthly price you can cancel anytime — the next step is a quick eligibility check. When a commercially available product isn't the right fit, a licensed clinician may determine a compounded option made through a licensed pharmacy is appropriate for an individual patient. We'll tell you honestly if it's not right for you.

→ **Start your eligibility check.**

Compounded medications are not FDA-approved and are not the same as Ozempic, Wegovy, Zepbound, or Mounjaro. GLP-1 medications can support weight management when prescribed as part of a care plan. Possible side effects include nausea, vomiting, diarrhea, constipation, and fatigue, among others. Results vary. This assessment is educational and does not diagnose or treat any condition or recommend any specific dose. Prescriptions require evaluation by a licensed clinician.
